

INTRODUCTION TO ARTIFICIAL INTELLIGENCE

CHAPTER #1

Instructor: ANAUM HAMID

COURSE CATALOG

1. Introduction and Agents (chapters 1,2)
2. Search (chapters 3,4,5,6)
3. Logic (chapters 7,8,9)
4. Planning (chapters 11,12)
5. Uncertainty (chapters 13,14)
6. Learning (chapters 18,20)
7. Reinforcement Learning

TEXTBOOK

Artificial intelligence: A modern approach (4rd edition), Stuart Russell and Peter Norvig

MARKS DISTRIBUTION

- **Assignments** **10 (Best 3 out of 4)**
- **Midterms** **15 each (x2= 30)**
- **Quiz** **10 (Best 3 out of 4)**
- **Final** **50**

AGENDA

- Introduction to artificial intelligence?
- A very brief history of AI
- Foundations of AI
- AI state of Art
 - How much progress has been made in different aspects of AI

WHAT MAKES HUMAN INTELLIGENT?

Learn

Learning and
Adapting by

What is AI ?

AI Definition by John McCarthy

(American computer scientist and cognitive scientist)

What is artificial intelligence?

It is the science and engineering of making intelligent machines, especially intelligent computer programs

<http://www-formal.stanford.edu/jmc/whatisai/whatisai.html>

AI Definition by John McCarthy

What is intelligence

Intelligence is the computational part of the ability
to achieve goals in the world

<http://www-formal.stanford.edu/jmc/whatisai/whatisai.html>

What is an AI?

“The study and design of intelligent agents, where an intelligent agent is a system that perceives its environment and takes actions that maximize its chances of success.”

Russel and Norvig, AIMA
book

HISTORY OF AI

- 1950: Turing
 - Turing's "Computing Machinery and Intelligence"
- 1956: birth of AI
 - Dartmouth meeting: "Artificial Intelligence" name adopted
- 1950s: initial promise
 - Early AI programs, including
 - Samuel's checkers program
 - Newell & Simon's Logic Theory
- 1986-- Rise of machine learning
 - Neural networks return to popularity
 - Major advances in machine learning algorithms and applications
- 1990-- Role of uncertainty
 - Bayesian networks as a knowledge representation framework
- 1995-- AI as Science
 - Integration of learning, reasoning, knowledge representation
 - AI methods used in vision, language, data mining, etc

Artificial Intelligence

Intelligence displayed by machines

OR

The capacity of a machine to imitate
intelligent human behaviour

ML and DL

A bunch of statistical algorithms and tools to learn from the data

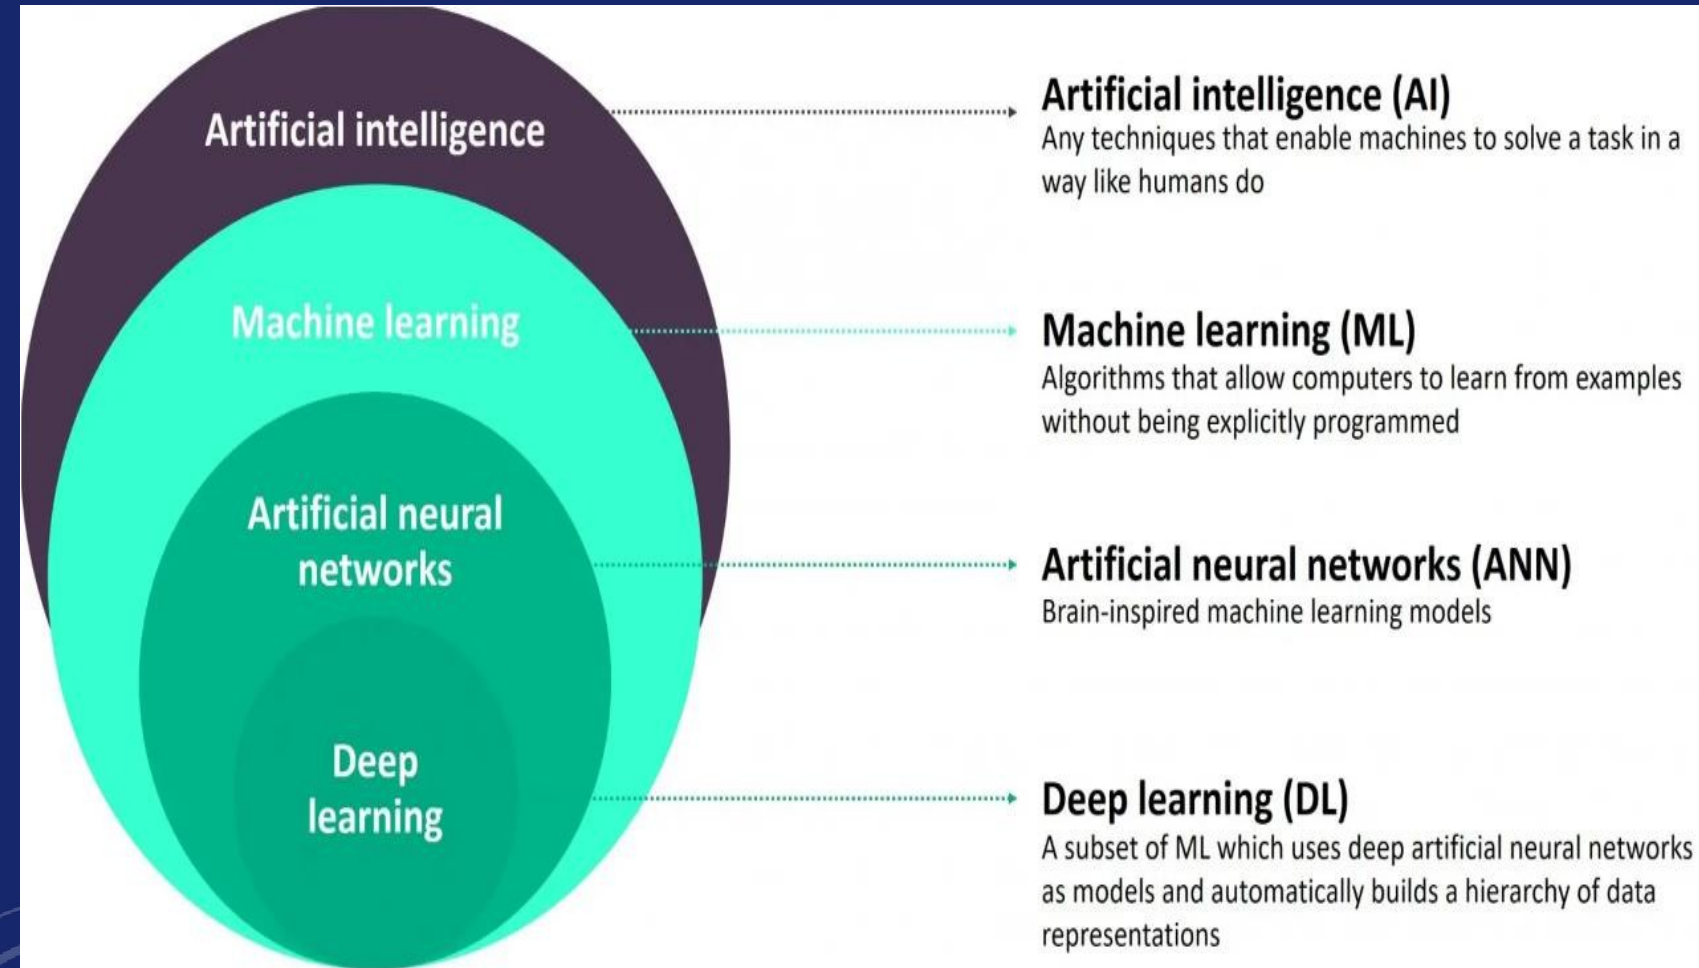

Connected with algorithms inspired by the structure and function of the brain called "Artificial Neural Networks"

DL (BIOLOGICAL NEURON)

(BIOLOGICAL NEURON)

Biological Neuron	Artificial Neuron
Dendrites	Input
Cell Nucleus(Soma)	Node
Axon	Output
Synapse	Interconnections

ARTIFICIAL NEURON

Training set	
Inputs	Output
000	001
001	010
010	011
011	100
100	101
101	110
110	111
111	000

Train Data

Feature vector

Label

(?)

Deep learning 3 connected layers

Inference

Output

(Car)

STATE OF THE ART

- Deep Blue defeated the reigning world chess champion Garry Kasparov in 1997
- AI program proved a mathematical conjecture (Robbins conjecture) unsolved for decades
- NASA's on-board autonomous planning program controlled the scheduling of operations for a spacecraft
- Speech recognition: A traveler calling United Airlines to book a flight can have the entire conversation guided by an automated speech recognition and dialog management system.
- Face recognition software available in consumer cameras

WHAT IS ARTIFICIAL INTELLIGENCE?

It is the science and engineering of making intelligent machines, especially intelligent computer programs. It is related to the similar task of using computers to understand human intelligence, but AI does not have to confine itself to methods that are biologically observable.

Views of AI fall into four categories:

- Thinking Humanly
- Acting Humanly
- Thinking Rationally
- Acting Rationally

Definitions

Human performance metric: involving observations
and hypothesis

Ideal or rational performance metric: combination of
mathematics and engineering

What is AI?

Four schools of thoughts (Russel & Norvig)

Thinking humanly	Thinking rationally
<p>“The exciting new effort to make computers think... machines with minds, in the full and literal sense.” (Haugeland, 1985)</p>	<p>“The study of mental faculties through the use of computational models.” (Charniak & McDermott, 1985)</p>
Acting humanly	Acting rationally
<p>“The study of how to make computers do things which, at the moment, people are better.” (Rich & Knight, 1991)</p>	<p>“Computational Intelligence is the study of the design of intelligent agents.” (Poole et al., 1998)</p>

ACTING HUMANLY: TURING TEST

- Alan Turing (1950) "Computing machinery and intelligence"
- "Can machines think?" □ "Can machines behave intelligently?"
- Operational test for intelligent behavior: the Imitation Game

It was designed to provide a satisfactory operational definition of intelligence. A computer passes the test if a human interrogator, after posing some written questions, cannot tell whether the written responses come from a person or from a computer.

THINKING HUMANLY: THE COGNITIVE MODELING APPROACH

- Requires detailed **matching of computer behavior and timing** to detailed **measurements of human subjects** gathered in psychological experiments.
- Cognitive Science approach
 - Try to get “inside” our minds
 - E.g., conduct experiments with people to try to “reverse-engineer” how we reason, learning, remember, predict
- So, we need to get **inside the actual workings of human minds**.
- There are three ways to do this:
- through **introspection**—trying to catch our own thoughts as they go by;
- through **psychological experiments**—observing a person in action;
- and through **brain imaging**—observing the brain in action.

THINKING RATIONALLY: LAWS OF THOUGHT

- Formalize “correct” reasoning using a mathematical model (e.g. of deductive reasoning/logical conclusion).
- Logics Program: Encode knowledge in formal logical statements and use mathematical deduction to perform reasoning:
- **Problems:**
 - -Formalizing common sense knowledge is difficult.
 - -General deductive inference is computationally intractable.

the pigeon experiment classic box-and-banana problem

<https://www.youtube.com/watch?v=mDntbGRPeEU>

ACTING RATIONALLY: THE RATIONAL AGENT

- An agent is an entity that perceives its environment and is able to execute actions to change it.
- Agents have inherent goals that they want to achieve (e.g. survive, reproduce).
- A **rational agent** acts in a way to **maximize the achievement of its goals**.
- True maximization of goals requires omniscience and unlimited computational abilities.
- Limited rationality involves maximizing goals within the computational and other resources available.

FOUNDATIONS OF ARTIFICIAL INTELLIGENCE

- **Philosophy** Logic, methods of reasoning, mind as physical system, foundations of learning, language , rationality.
- **Mathematics** formal representation and proof, algorithms , computation.
- **Probability/statistics** modeling uncertainty, learning from data
- **Economics** utility, decision theory, rational economic agents
- **Neuroscience** neurons as information processing units.
- **Computer engineering** building fast computers
- **Psychology** how do people behave, perceive, process cognitive information, represent science knowledge.
- **Linguistics** knowledge representation, grammars
